CATALYTIC TREATMENT OF GASEOUS EFFLUENTS CONTAINING VARYING AMOUNTS OF SULFUR COMPOUNDS

ABSTRACT OF THE DISCLOSURE

Active alumina catalysts, well suited for the Claus reaction, for the hydrolysis of organosulfur compounds and for catalytically removing objectionable sulfur compounds from gaseous effluents comprised thereof, contain a cocatalytically effective amount of sodium values, such effective amount, expressed by weight of Na₂O, ranging from 1,200 ppm to 2,700 ppm.
